Exercises

EXERCISE 1

In this exercise, create a new IntelliJ project named `CarInventory`. Save it in your default `LearnToCode\Workbook2\Mod02` folder. Make sure it is using Java 17!

For each class you have in your existing car rental project, create a new Java class using File -> New -> Class.

In your Vehicle class, re-code the class properties (`id`, `makeModel`, etc). Now use IntelliJ tools to: 1) create a parameterized constructor, 2) create getters and setters for each property, and 3) code the `toString()` method.

You can port over any remaining code you have by copying it to the clipboard and pasting it in the IntelliJ project.

Check the Problems window to see if you have any errors. Once you have fixed them all, run the application by clicking the green arrow on the toolbar!

Finally… make sure each file is indented correctly by pressing CTRL+ALT+L

Whallaaaaa!
